Database & Systems Analysis: Academic project experience in database design, requirements gathering, system analysis, role-based access control, and software testing.

Projects

Automotive Service Center Management System

September 2034 - May 2025

Developed an integrated management system for automotive service centers to streamline workshop operations, appointment scheduling, and customer record management. Designed a centralized database for inventory tracking, spare parts management, and maintenance invoicing. Implemented role-based access control for administrators, reception staff, and technicians to support data security. Conducted system analysis, gathered requirements, and performed user testing to improve usability and operational efficiency.

- Developed a centralized system for managing automotive workshop operations and customer records.
- Designed a database structure for inventory, spare parts, and maintenance invoices.
- Implemented role-based access control for three user groups: administrators, reception staff, and technicians.
- Performed system testing to improve usability and operational efficiency.
